group meeting
19 July 2017

Systematic Errors and σ_{NCQE}

- t2k.org
- NominalXsec.py calculates the mean and median flux, as well as the flux-averaged nominal cross section based on NEUT and Ankowski
- SysError.py calculates the systematic uncertainties
- StatError.py calculates the uncertainty on the final cross section introduced by the statistical uncertainty in the data

Mistake with Prob3++ replacing SterileAna

- Prob3++ is simpler than SterileAna
- I need some if statements for
 - tree.isCC
 - tree.appeared
- followed old ncgamma/SterileAna/SterileAna/SterileOsc.cc

```
if (tree.isCC !=0 and tree.isCC!=1): print "isCC = ",tree.isCC
if tree.appeared !=0: print "appeared = ",tree.appeared

if tree.isCC == 1:
    if tree.appeared == 1: posc = b.GetProb(2,1)
    elif tree.inu == 14 or tree.inu == 12 or tree.inu == -14: posc = b.GetProb(nuf lav,nuf lav)
    else: posc = 1
else:
    if tree.appeared == 1: posc = 0
    elif tree.inu == 14 or tree.inu == 12 or tree.inu == -14: posc = 1
    else: posc = 1
```

```

Summary

I have been through all ncgamma MC and data analysis for Run 4 on the new computer, in the meantime making improvements to:

- NEUT 5.1.4.2 → NEUT 5.3.2
- SterileAna → Prob3++
- Alex T2KReWeightvIp15 → T2KReWeightvIr27p3 (with NCQE)
- FHC → FHC and RHC

Summary

- You'll never see this schematic again...

Summary

... hopefully

I haven't updated the flux yet

Huang-san	my improvements
I 1a nominal flux, I 1b v3.2 tuning	I 3 a nominal flux, I 3a v1.1 tuning

I plan to update the flux, and run through Run 4 again (quickly!)

Next Steps

- analyze Run 1–4, and compare results to TN-244
- carefully analyze Run 5, which has both FHC and RHC
- analyze Run 1–7, possibly Run 8 too

Extending to DM search

- sensitivity study, with Rose's scattering events in skdetsim and FLUKA for production
- timing cut improvements, reduce +/- 100 ns of beam pulse
- background and systematics studies
